Smears And Frozen Sections In Surgical Neuropathology: A Manual

Synopsis

This 678-page book is a highly illustrated guide for the intraoperative interpretation of central nervous system surgical specimens. The two principal techniques—smear preparations and frozen sections—are described in great detail. Introductory chapters address general approaches to specimen acquisition and preparation; specific clinical and radiological features; differential diagnosis by site; tumor and nontumor entities with specific pathological features; and normal cells and tissues potentially mistaken for abnormalities. The bulk of the text describes specific clinicopathological entities, in over eighty chapters. Most of the latter present bulleted summaries of clinical and radiological features, similarly formatted sections on cytological (smear preparations) and histological (frozen sections) findings, and detailed differential diagnoses. There are over fifteen hundred illustrations covering the practical aspects of real-time, real-world cytological and histological diagnoses. Designed primarily for pathologists, it will be extremely useful for neurosurgeons as well, in their formulations of a differential diagnoses.

Customer Reviews

I bought this book to use as a reference text in our frozen section room, and it has proven to be an excellent quick resource for the occasional unusual CNS tumor. In particular the organization of the book in small, digestible segments makes it a relatively quick, but fully comprehensive read. One of the best points regarding the book is the close integration with radiographic features and cytology preparations in describing each tumor. I would highly recommend this purchase for any resident or pathologist who will be encountering neuropathology cases in their practice.
